Distribution of Virginia Adjusted Gross Income by Income Class and Locality, 1984

John L. Knapp and Robert W. Cox

INTRODUCTION

Administrative records from the Virginia Department of Taxation provide a useful source of information on local income distribution. This report is the thirteenth in a series based on the Department's records. The first report covered the distribution of Virginia adjusted gross income (AGI)[1] in 1972, and the second covered the distribution in 1973 with additional information on total AGI and number of tax returns beginning with 1963. The next ten reports covered the distribution of AGI in each year, 1974 through 1983; this report shows comparable data for 1984.

Virginia AGI is defined as federal adjusted gross income with a few alterations. In 1984, federal AGI included most types of income except the following: 1) most Social Security benefits and other transfer payments[2]; 2) employer contributions to private pension and health plans; 3) non-cash imputed income; 4) income in-kind; 5) 60% of long-term capital gains; and 6) certain business expenses. The modifications used to derive Virginia AGI included adding interest from municipal bonds of other states, federal deductions allowed for a married couple when both work, the ordinary income portion of a lump sum distribution from a qualified retirement plan, and 30% of the federal deduction allowed under the Accelerated Cost Recovery System. Other modifications were the subtracting from federal AGI of the following items: Virginia state government retirement benefits, interest from federal obligations, benefits received under Title II of the Social Security Act, Tier 1 Railroad Retirement Act, and Workman's Compensation Act, and $400 for each taxpayer or spouse age 65 or over. Changes in tax laws have had some effect on the historical comparability of AGI. For example, beginning in 1982, up to $2,000 of payments made to an Individual Retirement Account (IRA) is deductible, even if the taxpayer is covered by an employer's pension plan.

AGI data cover all individuals and married couples required to file a return for 1984, which included: 1) anyone who had Virginia income tax withheld or who paid an estimated income tax for 1984; 2) any individual with AGI more than $1,900; 3) a married couple with both persons under age 65 with a combined AGI more than $2,500; 4) a married couple with one spouse 65 or over with a combined AGI more than $3,500; and 5) a married couple with both persons 65 or over with a combined AGI more than $4,500.

In 1984, AGI totaled $53.6 billion and amounted to 72% of Virginia personal income. Personal income is a broad measure of income that includes transfer payments and certain types of non-cash income that are not taxable. The proportion of the population covered by the AGI data can be roughly estimated by

[1] In this report, AGI refers to Virginia adjusted gross income.

[2] Starting in 1984, some Social Security benefits were included in federal AGI.

comparing the reported number of personal and dependent exemptions with a separate count of the total population. In 1984, the number of exemptions was 4,948,323 or 88% of Virginia's 1984 population of 5,635,500 as estimated by the Tayloe Murphy Institute.[3]

A brief review of the economic conditions in 1984 may help to place the figures in this report in perspective. Both the national and state economies experienced continued strong growth that began in late 1982. For the year as a whole, real gross state product, a measure of total output, rose 8.0%, much higher than the 1958-84 trend growth rate of 4.3% annually. Virginia nonagricultural wage and salary employment increased 5.4% from 1983 to 1984. The state's unemployment rate, which averaged 6.1% in 1983, fell to 5.0% one year later. Inflation, measured by the U.S. Consumer Price Index, was 4.3% over the same period.

ANALYSIS

Introduction

The appendix tables contain data on all returns and on two subcomponents—married couple returns and individual returns. In addition, there is information on AGI per exemption and an index of income concentration. These measures are discussed in the following pages.

All Returns

Statewide, the median AGI was $16,843, up 5.6% from the preceding year. However, after adjustment for inflation, the median rose 1.3%. The overall county median was $18,055 compared to $15,322 for cities (see Table A1). One reason for this difference was that married couple returns, which tend to have higher incomes than individual returns, represented a larger proportion of the returns for the counties than for the cities. The highest income area, Fairfax County ($25,615), had a median AGI of 2.5 times greater than the lowest area, Northampton County ($10,157). Other high income localities were Chesterfield County ($24,492), Prince William County ($23,392), Loudoun County ($23,145), and Arlington County ($22,049). All of the top five localities were located either in the Northern Virginia or Richmond area. There is little annual change in the localities ranked among the top five, but those ranked in the bottom five frequently vary. However, in 1984, there was limited turnover. In addition to Northampton County, the low income localities were Accomack County ($10,865), Lunenburg County ($11,480), Brunswick County ($11,582), and the city of Galax ($11,681).

Together, the eight metropolitan statistical areas (MSA's)[4] had a median AGI of $18,189 compared to $14,232 for the non-MSA portions of the state. (See pages 31-33 for listings of localities contained in MSA's and planning districts.) Among the MSA's, the Virginia portion of the Washington, D.C.-Md.-Va. MSA[5] had the highest median AGI ($23,427). The lowest median was in the Danville MSA ($13,617).

[3]Julia H. Martin and David W. Sheatsley, Estimates of the Population of Virginia Counties and Cities: 1983 and 1984 (Tayloe Murphy Institute, University of Virginia: August 1985), p. 16.

[4]The MSA data refer only to the Virginia portion of those MSA's that include parts of other states. On June 30, 1983, the Richmond MSA and the Petersburg-Colonial Heights-Hopewell MSA were combined to form the Richmond-Petersburg MSA. At the same time, the Norfolk-Virginia Beach-Portsmouth MSA and the Newport News-Hampton MSA were combined to form the Norfolk-Virginia Beach-Newport News MSA. Although this report shows data for the combined MSA's, data for the uncombined MSA's are available upon request.

[5]Hereafter, the Virginia portion of the Washington, D.C.-Maryland-Virginia MSA is referred to as the Northern Virginia MSA.

Among the twenty-two planning districts, the medians ranged from $23,532 in the Northern Virginia Planning District to $10,644 in the Accomack-Northampton Planning District.

In addition to providing median AGI, Table A1 contains information on the distribution of AGI. Statewide, 15.8% of the returns had AGI of less than $5,000; 16.3% had $5,000 to $9,999; 13.9% had $10,000 to $14,999; 10.9% had $15,000 to $19,999; 9.0% had $20,000 to $24,999; 7.7% had $25,000 to $29,999; 11.1% had $30,000 to $39,999; 6.6% had $40,000 to $49,999; 6.2% had $50,000 to $74,999; and 2.5% had $75,000 or more.

As might be expected, the locality with the highest median income had the largest percentage of returns in the highest AGI class. In Fairfax County, 6.8% of the returns showed incomes of $75,000 or more.

The median AGI on all returns is not a good proxy for median household money income. In 1979, the income year reported in the 1980 Census, Virginia median household income was $17,475—a figure 43% larger than 1979 median AGI on all returns ($12,188). Although there were many reasons for the difference, the principal one was that members of the same household often filed separately. An example of this would be a return filed by a child living in the same household with parents who also filed. The end result was that the number of returns exceeded the number of households by 9.2%.[6]

Married Couple Returns

In 1984, returns filed by married couples accounted for 50.2% of all returns and 72.8% of the AGI. Married couple returns are composed of all returns filed by husband-wife families, including those with dependents.

Statewide, median AGI for married couples was $27,987, a figure 6.4% higher than in 1983. However, after adjustment for changes in purchasing power, median income rose by 2.1%. Since the beginning of this series in 1972, there has been a large rise in AGI as measured in current dollars (see Figure 1). However, in terms of constant dollars adjusted for changes in the CPI, there has been a slight rise; over the eleven-year period, real median AGI rose by 2.9%, more than 2% of that in 1984 alone.

From 1979 to 1984, the percentage change in current dollar AGI reported on married couple returns ranged from 49.5% in Fauquier County to 21.8% in Buchanan County (see Table A2). The largest change experienced by a city was 48.4% for Radford City. The counties of Albemarle (48.3%) and Loudoun (48.2%), the city of Poquoson (48.2%), and the county of Southampton (48.0%) also experienced high rates of growth. Tazewell County (23.1%) was a distant second for the lowest rise in nominal AGI. Figure 2 shows the number of localities in five growth categories: less than 30%, 30-34.9%, 35-39.9%, 40-44.9%, and 45% and over.

The 1984 married couple return median AGI for all counties was $28,817, and that for the cities was $26,984 (see Table A3). All of the five highest localities were in Northern Virginia. Fairfax County ($45,878) and Fairfax City ($41,750) led, followed by Arlington County ($39,774), Loudoun County (38,017), and Prince William County ($37,841). The five lowest localities were the counties of Lee ($16,573), Charlotte ($16,771), Northampton ($17,121), Grayson ($17,165), and Lunenburg ($17,305).

The married couple return median AGI in the MSA portion of the state was $31,507 compared to $22,270 for the non-MSA portion. Seven out of every ten Virginians live in an MSA. Among the MSA's, the Northern Virginia MSA had the highest median ($41,843), followed distantly by the Richmond-Petersburg MSA ($31,186). The lowest median was in the Virginia portion of the Johnson City-Kingsport-Bristol MSA ($19,196).

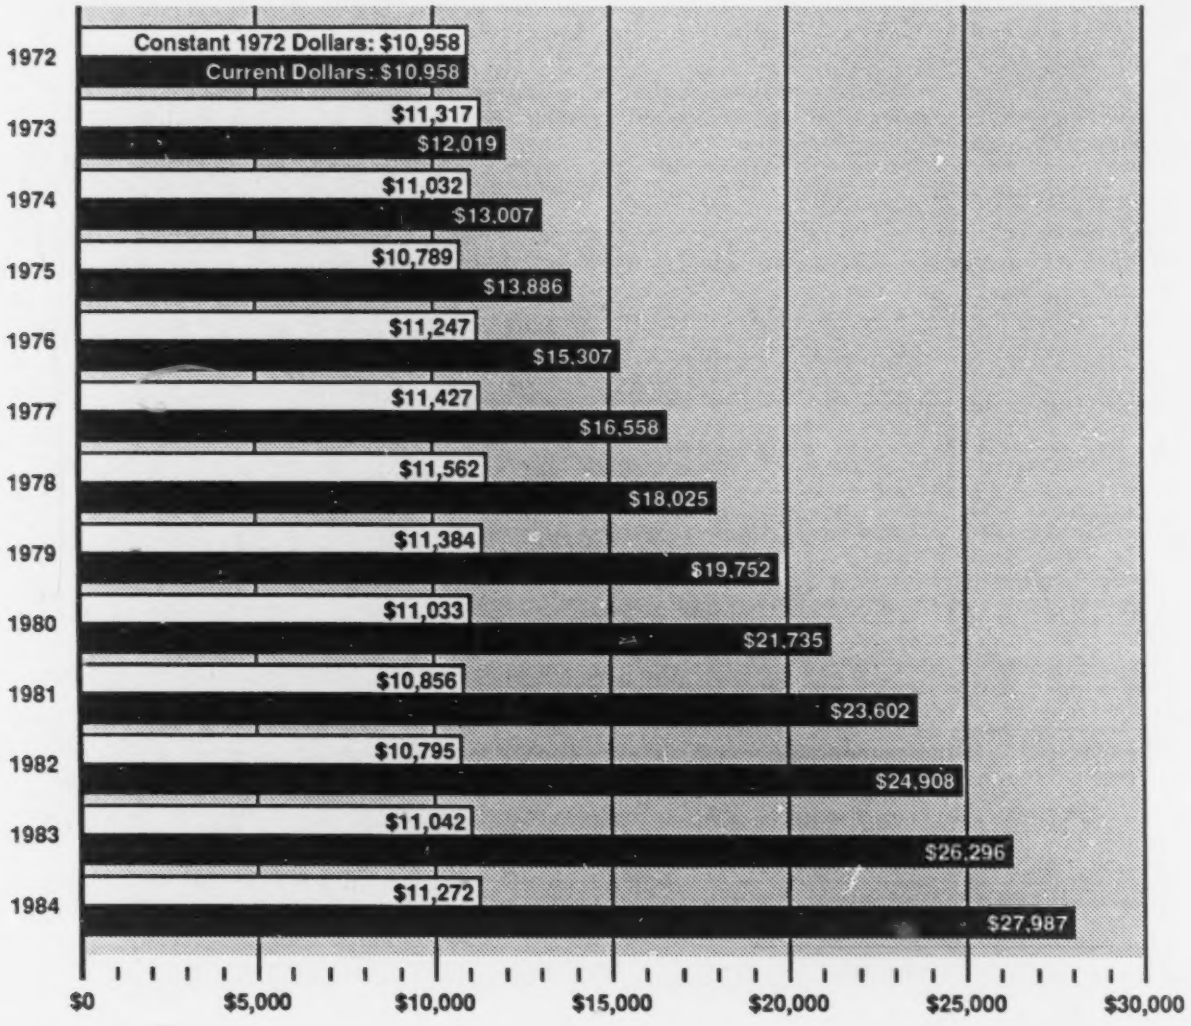
Figure 1.
Virginia Median AGI Per Married Couple Return, 1972-1984

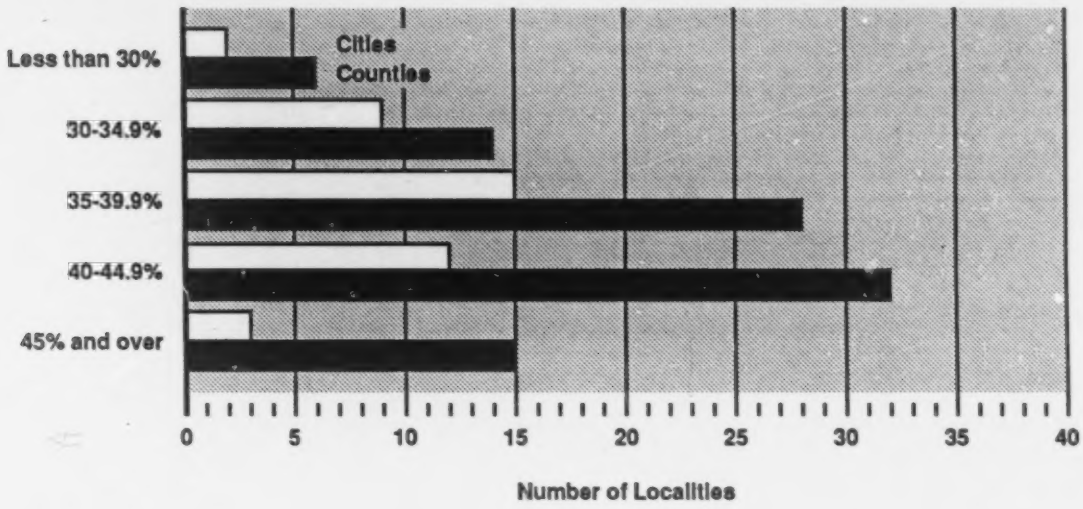


To a certain extent, the variation among MSA's in median AGI reflects differences in cost of living. When the data are adjusted using a relative price index, the Northern Virginia portion of the Washington, D.C.-Md.-Va. MSA remains the highest income metropolitan area (see Table 1). However, the adjustment narrows the differences among areas. In actual dollars, the ratio of highest (Northern Virginia) to lowest[7] (Lynchburg) was 1.64 to 1. After adjustment for price differences, the ratio of highest (Northern Virginia) to lowest (Charlottesville) was 1.37 to 1.

---

[7]This comparison excludes the Danville and Johnson City-Kingsport-Bristol MSA's because of the unavailability of price indexes for them. Also, for this table only we use the old definitions of the MSA's (specifically, Richmond MSA, Petersburg-Colonial Heights-Hopewell MSA, Norfolk-Virginia Beach-Portsmouth MSA, and Newport News-Hampton MSA) because data on cost-of-living are not available for the combined areas.

Figure 2.
Growth in Median AGI for Married Couple Returns, 1979-1984



Among the planning districts, the median AGI for married couples ranged from $42,318 in the Northern Virginia Planning District to $18,226 in the Accomack-Northampton Planning District.

Statewide, 4.7% of the returns filed by married couples had AGI of less than $5,000; 8.3% had $5,000 to $9,999; 9.8% had $10,000 to $14,999; 10.1% had $15,000 to $19,999; 10.7% had $20,000 to $24,999; 10.8% had $25,000 to $29,999; 18.0% had $30,000 to $39,999; 11.7% had $40,000 to $49,999; 11.4% had $50,000 to $74,999; and 4.6% had $75,000 or more (see Figure 3). The greatest concentration of high incomes occurred in Fairfax County where 43.3% of the returns found were in the two income classes above $49,999.

Median AGI reported on married couple returns is a fairly good proxy for median family Census money income even though AGI differs from Census money income, and married couples are a subset of all families.[8] According to the 1980 Census, Virginia median family income in 1979 was $20,018. In 1979, median AGI reported by married couple families was $19,752. Thus, median AGI was 99% of the Census figure. For individual counties and cities, the percentage varied depending on local conditions such as the population living in poverty, the number of military personnel, the number of persons receiving transfer payments (e.g., Social Security benefits and welfare assistance), and the accuracy of geographic coding of tax returns.

Individual Returns

Tax returns of single, divorced, separated, or widowed taxpayers are classified as individual returns. In 1984, statewide median AGI for individual returns was $9,765, an increase of 5.0% over 1983. After adjustment for inflation, median AGI increased by 1.0%. The median for counties was $9,812, and that for cities was $9,745 (see Table A4). The five highest localities were Arlington County ($17,032),

---

[8]The Census definition of family includes families with only one spouse present, whereas Virginia AGI married couple returns are limited to husband-wife families that file returns.

[a]1984 data in Eleanor G. May, Consumer Price Indicators for Virginia Metropolitan Areas, 1984, Revised (Charlottesville: Tayloe Murphy Institute, November 1984), Table 1, p. 6.

[b]The relative price index used to adjust actual dollars to constant dollars excluded the Danville MSA and the Virginia portion of the Johnson City-Kingsport-Bristol MSA.

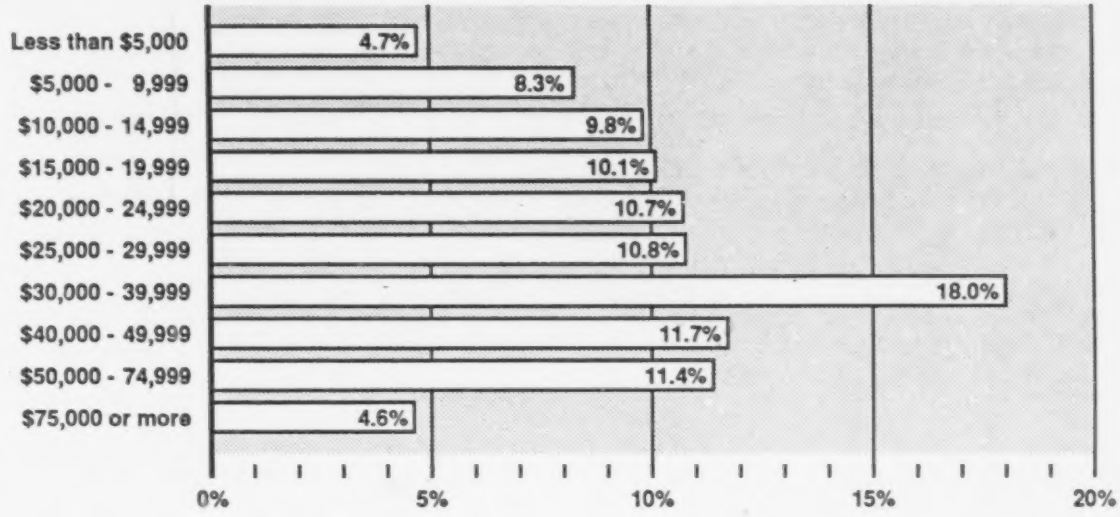
[c]Virginia portion only.

Alexandria City ($16,290), Falls Church City ($13,586), Fairfax County ($13,041), and Fairfax City ($11,941). The five lowest localities were Dickenson County ($6,847), Northampton County ($6,992), Lee County ($7,068), Norton City ($7,175), and Accomack County ($7,258).

The individual return median for all MSA's was $10,523, and for non-MSA's it was $8,276. The Northern Virginia MSA had the highest median ($13,623), and the Virginia portion of the Johnson City-Kingsport-Bristol MSA had the lowest median ($8,173).

Among the planning districts, the medians ranged from $13,762 in the Northern Virginia Planning District to $7,178 in the Accomack-Northampton Planning District.

Figure 3.
Distribution of Virginia Married Couple Returns by AGI Class, 1984



AGI Per Exemption

Table A5 shows AGI per exemption. To reduce double counting, the extra exemptions for age and blindness have been excluded. However, double counting remains because some children with taxable income are counted twice—once on their parents' return and again on their own.

AGI per exemption is similar to a per capita measure except the divisor contains only the population with adjusted gross income rather than the total population. For the state as a whole, 1984 AGI per exemption was $10,835, up 8.4% over 1983. For counties, the figure was $10,910 and for cities, $10,401 (see Table A5). Among localities, the five highest were Arlington County ($17,279), Alexandria City ($15,822), Fairfax County ($15,229), Fairfax City ($14,590), and Fauquier County ($14,579). The five lowest localities were the counties of Charlotte ($6,272), Lunenburg ($6,277), Buckingham ($6,516), Brunswick ($6,553), and Greensville ($6,622).

Variation in AGI per exemption among localities may be measured in several ways. The simplest approach is to compute the ratio of the highest to the lowest observation. In 1984, the ratio was $17,279 to $6,277 or 2.75 to 1. A more sophisticated measure is the coefficient of variation, which shows the standard deviation as a percentage of the mean. The higher the value, the greater the variation. In 1984, the coefficient of variation was 21.8%, virtually unchanged from the results for earlier years.

AGI per exemption was $11,653 in the MSA portion of the state compared to $8,397 in the non-MSA portion. Among the MSA's, Northern Virginia, with an AGI per exemption of $14,636, outstripped the other MSA's by a wide margin. The Johnson City-Kingsport-Bristol MSA had the lowest AGI per exemption ($8,083).

Among the planning districts, AGI per exemption was highest in the Northern Virginia Planning District ($14,797), followed distantly by the Richmond Planning District ($11,448). The Accomack-Northampton Planning District had the lowest figure ($7,070).

Index of Income Concentration

An index of income concentration[9] for all returns is shown in Table A6. The index is a measure of the equality of income distribution. If all taxpayers had the same income, the index would be zero. The greater the inequality of income distribution, the higher the value of the index.

In 1984, the state index of income concentration average was 0.348. Among localities, the index ranged in value from 0.472 in Martinsville City to 0.282 in Manassas Park City. Generally, the large central cities had greater inequality than their associated suburbs. For example, Richmond City had an index of 0.375, compared to 0.303 in Chesterfield County, 0.322 in Hanover County, and 0.327 in Henrico County.

The MSA and non-MSA portions of the state had similar indexes, 0.344 and 0.333, respectively. Among the ten MSA's, the indexes showed little variation, except for the Charlottesville MSA, which was higher than the other metropolitan areas.

Among the twenty-two planning districts, the greatest inequality of income was in the Rappahannock-Rapidan Planning District (0.383), followed by the Thomas Jefferson Planning District (0.359) and the Accomack-Northampton Planning District (0.355). The least amount of inequality occurred in the Mount Rogers Planning District (0.310).

COMPARISONS OF INCOME CONCEPTS

Census Money Income

Adjusted gross income is not the same as money income reported by the Bureau of the Census. In 1979, total AGI was 84% of Census total money income for Virginia.[10] Unlike Census money income, AGI excludes transfer payments such as Social Security benefits, welfare payments, and unemployment compensation. In addition, AGI does not cover persons with income below the filing requirement. Persons receiving transfer payments and those with income below the filing requirement are included in the tax statistics only if they had some additional taxable income or had to file in order to receive a refund for tax withheld.

AGI also excludes income of armed forces personnel who retain legal residence in another state. The omission of this military income means that AGI will comprise a smaller percent of Census money income in areas with a dense concentration of military personnel, such as Prince George County, Norfolk City, and Virginia Beach City. Furthermore, since non-military income and income of the spouse are taxable, the tax statistics may exaggerate the number of low AGI returns in these areas.

---

[9]Index of income concentration = $1/2 \sum_{i=1}^{k} \left| X_i - Y_i \right|$

where X_i and Y_i are uncumulated percentages of the distribution of total returns by AGI class (X) and the distribution of total AGI by AGI class (Y). For a description of the method of computation, see U.S. Bureau of the Census, The Methods and Materials of Demography by Henry S. Shryock, Jacob S. Siegel, and associates. (Washington, D.C.: Government Printing Office, 1971), pp. 178-80.

[10]U.S. Bureau of the Census, 1980 Census of Population: General Social and Economic Characteristics, pp. 11, 16.

AGI does include certain capital gains, an income category not included in the definition of Census money income. At the state level, AGI also contains some nonresident income, whereas Census income is restricted to resident income.

A final difference between the two concepts is the reporting unit. The principal Census reporting units are families, unrelated individuals, and households. The major tax reporting units are individual returns and married couple returns. Married couple returns are further subdivided into joint, combined, and separate returns. None of the tax units is entirely comparable with any Census unit.

Personal Income

AGI differs also from the concept of personal income developed by the U.S. Department of Commerce, Bureau of Economic Analysis (BEA). Personal income is a broader concept than either Census money income or AGI. Unlike AGI, personal income includes: 1) all transfer payments such as Social Security and unemployment benefits; 2) certain fringe benefits; 3) imputed income such as wages and salaries paid in-kind, the net rental value of owner-occupied houses, the net value of food and fuel produced and consumed on farms, and imputed interest earned from financial intermediaries; 4) dividends excluded from taxation; and 5) tax-exempt interest and dividend distributions. On the other hand, AGI includes certain items excluded from personal income: 1) personal contributions for social insurance (principally, employee Social Security taxes and federal employee retirement payments); and 2) all of short-term capital gains and 40% of long-term capital gains. Furthermore, there are differences in coverage. Personal income includes the income of certain categories not contained in AGI, the most important of which are low income persons not required to file a state tax return, non-resident members of the armed forces stationed in Virginia, and private trust, pension, health, and welfare funds. As previously mentioned, in 1984, state AGI reported on Virginia tax returns was 72% of total personal income.

LIMITATIONS OF THE DATA

The major limitations are the inaccuracy of some of the geographic coding, the treatment of data for married couples filing separate returns, and the method of deriving medians.

Geographic coding of the tax returns may be a problem in a few localities. Although taxpayers are required to show their city or county of residence, some taxpayers fail to provide correct information. Confusion of post office address with place of residence is the usual source of incorrect information.

Married couples can file in one of three ways--by using a joint return, a combined return, or separate returns. For 1984, the majority (92%) selected either the joint return or the combined return. The Department of Taxation statistics do not match the separate returns for each married couple. In the absence of matching, it was assumed for the purpose of calculating medians for married returns that within each AGI class two separate returns were equivalent to one joint or combined return. Although unavoidable, this was an extreme assumption since the more likely case is that a husband's AGI would fall in a different class than his wife's AGI.

Since all medians were derived from grouped data, it was necessary to make an assumption concerning the distribution of income within the class interval containing the median. In the absence of additional information, a uniform distribution was assumed. This procedure was probably adequate in most cases, but derivation of the medians from ungrouped data would have been preferable.

Table A1.
Adjusted Gross Income on All Returns, 1984

	NUMBER OF RETURNS [a]	AGI ($) TOTAL (000)	AGI ($) MEDIAN PER RETURN	PERCENTAGE DISTRIBUTION OF RETURNS BY AGI CLASS ($000) [b] LESS THAN 5.0	5.0 TO 9.9	10.0 TO 14.9	15.0 TO 19.9	20.0 TO 24.9	25.0 TO 29.9	30.0 TO 39.9	40.0 TO 49.9	50.0 TO 74.9	75.0 OR MORE

a/ Number of returns adusted by counting two married separate returns as equivalent to one married joint or combined return.

b/ Details may not add to 100.0 due to rounding.

c/ Returns unassigned to geographic areas because the proper city or county could not be ascertained or because the returns were filed by nonresidents.

a/ Number of returns adusted by counting two married separate returns as equivalent to one married joint or combined return.

b/ Details may not add to 100.0 due to rounding.

c/ Returns unassigned to geographic areas because the proper city or county could not be ascertained or because the returns were filed by nonresidents.
